

# EDIFICE™ Inventory Management

## MULTI-LOCATION

Inventory is designed to track information for multiple locations including inventory balances, reordering information, costs and purchasing data. Complete physical inventory capability by location makes local stock control an easy task.

## ADVANCED REPORTING

Reporting needs are often specific and the inventory reports and inquiries provide flexible parameters that make it easy to find what you want know.

Reports can be sorted, printed and viewed according to user defined ranges rather than the entire inventory.

## SERIALIZED TRACKING

Inventory is designed to track designated stock by serial number. This makes tracking big ticket items significantly easier and allows your utility to know exactly which item you are providing to a specific job or customer.

- The Inventory Management System was designed to meet the demanding present and future needs of utilities.
- Valuable cost, purchase and use data is stored for each inventory item by location if desired by the utility.
- Inventory has specific routines that make taking a physical count a snap and these routines can be performed anytime.
- Inventory can be deployed using an in-house server or in a secure hosted environment; you have the freedom of choice.

## Complete Stock Control

The EDIFICE Inventory Management System provides your utility with the tools necessary to focus on those areas vital to controlling inventory costs, while maintaining stock availability. With Inventory you will have more control over purchasing decisions that directly affect the capital you have tied up in inventory. There will be fewer out of stock oversights while in the midst of working on important jobs. Inventory is aware when on-hand stock is already committed to jobs that are not yet in process making forecasting stock needs and purchasing new inventory more scientific and less an art form. Inventory is packed with reports and inquiries that give your utility current, reliable management information when you need it most.

Designed and written using today's contemporary technology, the EDIFICE Inventory Management System provides utility districts and departments with a comprehensive inventory software tool. Inventory's user interface emphasizes "ease of use" and is designed to operate quickly and efficiently. Architected and built directly by Northern Data Systems, Inventory Management System is a module of the EDIFICE system. Whether you simply choose to implement Inventory now and or in the future you can have confidence that the entire system is designed to work together.
